

4. Aim

To perform a **DNS lookup** and obtain the IP address of a given domain as a basic OSINT (Open Source Intelligence) reconnaissance technique.

Algorithm

1. Start the program.
2. Read the domain name from the user.
3. Send a DNS lookup request.
4. Retrieve the IP address of the domain.
5. Display the IP address.
6. If the domain is invalid, display an error message.
7. Stop the program.

Code

```
import socket
```

```
domain = input("Enter domain: ")
```

```
try:
```

```
    ip = socket.gethostbyname(domain)
```

```
    print(f"IP Address of {domain} is {ip}")
```

```
except socket.gaierror:
```

```
    print("Invalid domain or lookup failed")
```

Output

```
Enter domain: google.com
```

```
IP Address of google.com is 209.85.200.113
```
