

EXPERIMENT 34

Domain Screening

AIM

To score domain names using rule-based suspicious indicators and classify them according to the resulting score.

ALGORITHM

1. Accept a list of domains.
2. Check length, digits, hyphens, and suspicious words.
3. Add points for each indicator.
4. Classify the domain using the total score.
5. Display the indicators responsible.

CODE

```
domains = ["google.com", "paypal-login-secure.com", "very-long-suspicious-login-domain-example.com"]
```

```
for domain in domains:
```

```
    score = 0
```

```
    reasons = []
```

```
    if len(domain) > 30:
```

```
        score += 1
```

```
        reasons.append("excessive length")
```

```
    if any(c.isdigit() for c in domain):
```

```
        score += 1
```

```
        reasons.append("numeric substitution")
```

```
    if domain.count("-") >= 2:
```

```
        score += 1
```

```
        reasons.append("multiple hyphens")
```

```
    if any(word in domain.lower() for word in ["login", "secure", "verify"]):
```

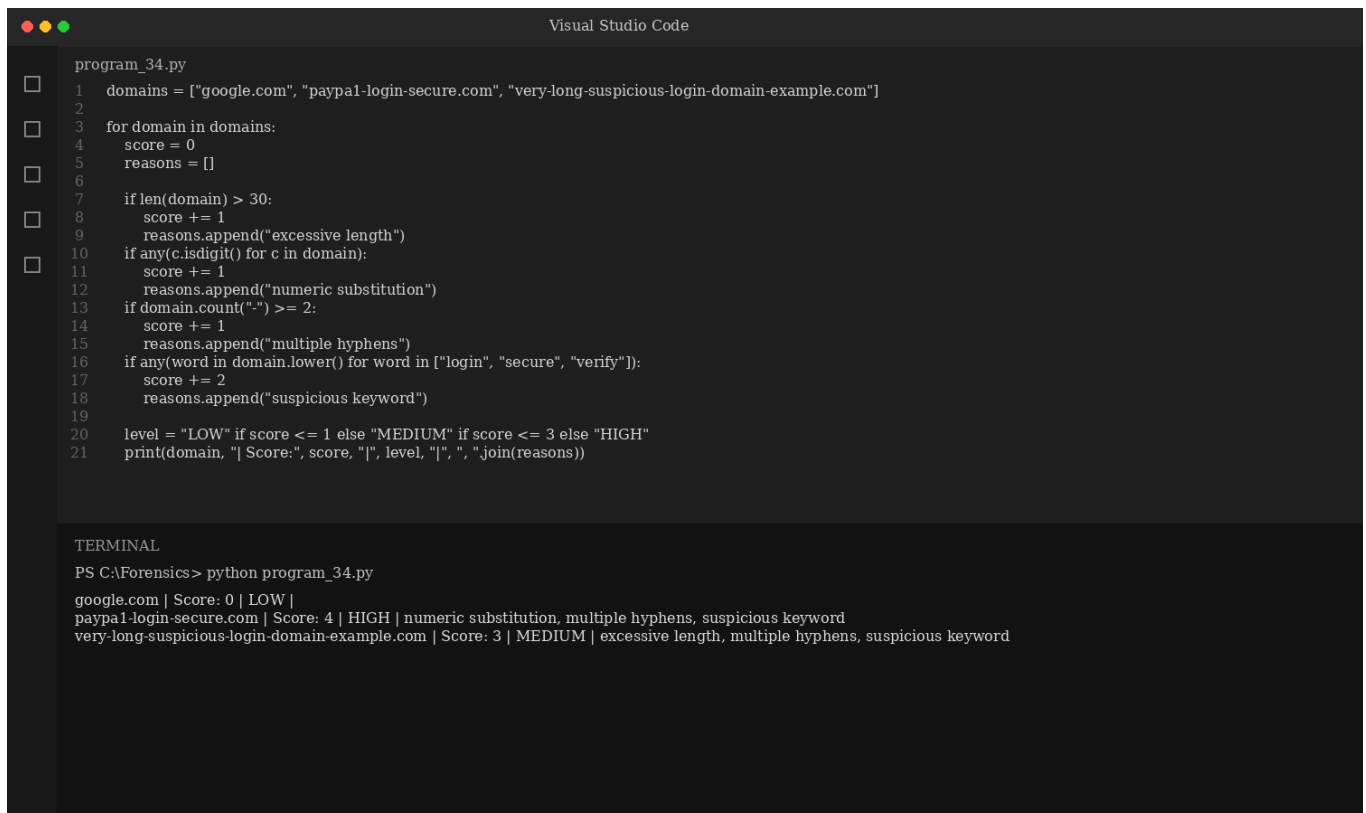

```
        score += 2
```

```
        reasons.append("suspicious keyword")
```

```
    level = "LOW" if score <= 1 else "MEDIUM" if score <= 3 else "HIGH"
```

```
    print(domain, "| Score:", score, "|", level, "|", ", ".join(reasons))
```

OUTPUT

```
Visual Studio Code

program_34.py
1 domains = ["google.com", "paypal-login-secure.com", "very-long-suspicious-login-domain-example.com"]
2
3 for domain in domains:
4     score = 0
5     reasons = []
6
7     if len(domain) > 30:
8         score += 1
9         reasons.append("excessive length")
10    if any(c.isdigit() for c in domain):
11        score += 1
12        reasons.append("numeric substitution")
13    if domain.count("-") >= 2:
14        score += 1
15        reasons.append("multiple hyphens")
16    if any(word in domain.lower() for word in ["login", "secure", "verify"]):
17        score += 2
18        reasons.append("suspicious keyword")
19
20    level = "LOW" if score <= 1 else "MEDIUM" if score <= 3 else "HIGH"
21    print(domain, "| Score:", score, "|", level, "|", ", ".join(reasons))

TERMINAL

PS C:\Forensics> python program_34.py
google.com | Score: 0 | LOW |
paypal-login-secure.com | Score: 4 | HIGH | numeric substitution, multiple hyphens, suspicious keyword
very-long-suspicious-login-domain-example.com | Score: 3 | MEDIUM | excessive length, multiple hyphens, suspicious keyword
```

RESULT

The program scores domains using rule-based suspicious indicators and classifies their risk.
